and H. ELSHEIKH\*\*\*

**Key words:** Biostratigraphy — Eocene — Oligocene — Planktonic Foraminifera — Ostracoda — Western Desert — Egypt.

## ABSTRACT

This paper deals with the study of planktonic foraminifera, larger foraminifera and ostracoda in the Oligocene sediments in four wells: Abu Tunis No. IX, East Faghur-I, Khalda No. I and North Ghazalat No. I, North Western Desert. It was possible to recognize the following foraminiferal biozones, which are from top to base: *Miogypsinoides complanatus/Lepidocyclus* spp. Zone = *Nummulites* aff. *bouillei* Zone and *Globorotalia opima opima* Zone of Chattian Age and *Globigerina ampliapertura* Zone and *Cassigerinella chipolensis* Zone of Rupelian Age. The topmost zone correlates well with that described from Tunis by Biely and Kohler (1976).

## INTRODUCTION

The stratigraphy of the Oligocene sediments attracted the attention of only a few workers, Beadnell (1905), Barron (1907), Ball (1939), Eames (1953), Drooger (1956 & 1964), Abdallah (1966), El Akkad & Dardir (1966), Norton (1967), Blow (1969), Fahmy *et al.* (1969), Marzouk (1970), Postuma (1971), Biely & Salaj (1971), Omara & Ouda (1972), Stainforth (1975), Biely & Kohler (1976), Bolli & Krasheninnikov (1977).

The present work deals with the investigation of the Oligocene sediments in the North Western Desert. Four wells are studied; they are (Khalda Well No. 1, North Ghazalat Well No. 1, Abu Tunis Well No. IX and East Faghur Well No. 1 (fig. 1).

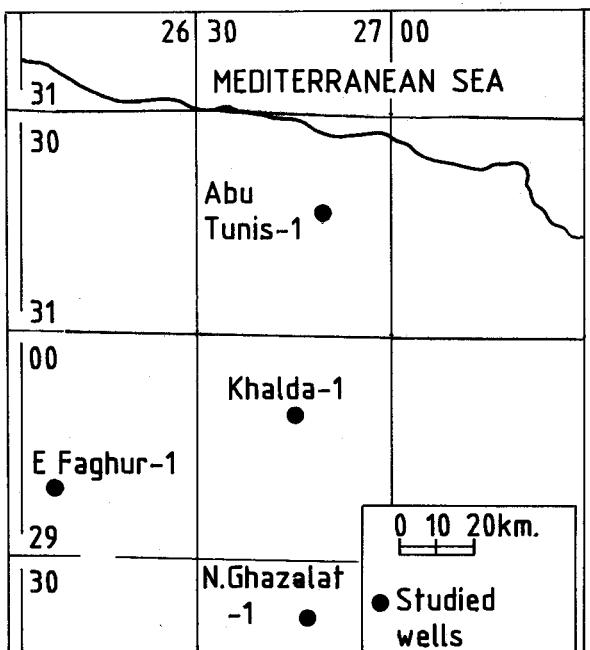

About 200 ditch samples and 40 thin sections of larger foraminifera were studied for their microfossil content. The main aim of this study is to subdivide the Oligocene sediments of this region into different biozones with the help of planktonic foraminifera, larger benthonic foraminifera and ostracoda. Subdivision of the Oligocene sediments into a Middle (Rupelian)

BIOSTRATIGRAPHY OF THE SUBSURFACE  
OLIGOCENE SEDIMENTS

**Fig. 1 Location map**

and an Upper (Chattian) on the basis of the foraminiferal biozones is achieved. Attempt is made to define the Late Eocene-Early Oligocene boundary.

### I. Stratigraphy of the Oligocene sediments in North Western Desert

This part deals with the stratigraphy of the Oligocene sediments of four wells (Khalda-1, Abu Tunis IX, East Faghur-1 and N. Ghazalat-1), located in the northern part of the Western Desert, Egypt, (Fig. 1).

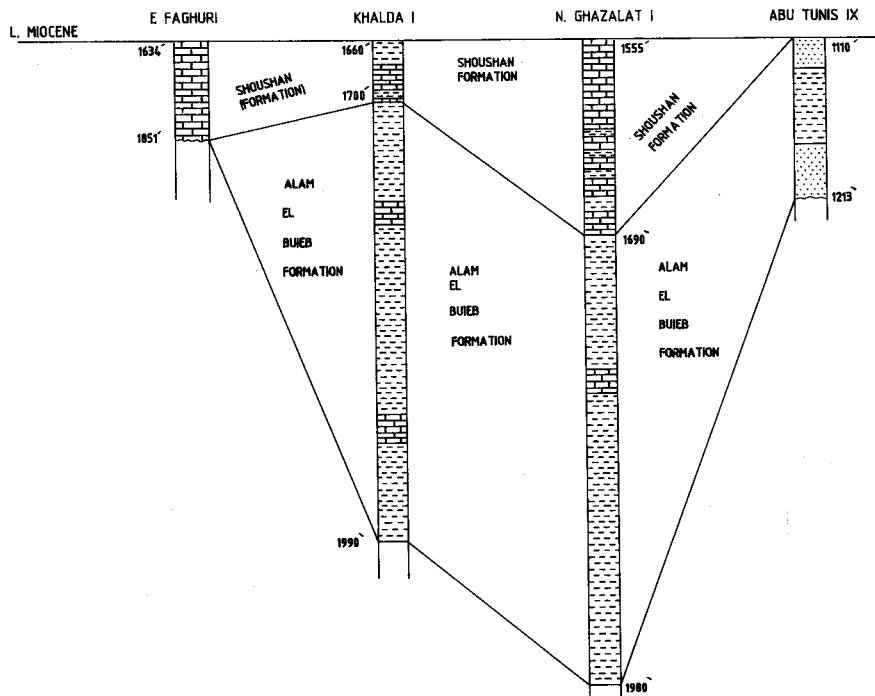

The Oligocene section in Khalda-1 and North Ghazalat-1 is represented by upper unit known as Shoushan Formation (mainly limestone) and lower unit is called Alam El Bueib Formation (calcareous shale). In Abu Tunis-IX the only represented formation is Alam El-Bueib. In East Faghur I, the Oligocene section is composed mainly of limestone (Shoushan Formation).

Figure (2) is a correlation chart of the Oligocene rock units between the studied wells in the North Western Desert, Egypt.

Table no. 1 shows a comparison between different rock stratigraphic units of the Oligocene in the Western Desert (After Omara and Ouda, 1972).

### II. Biostratigraphy

It was possible to subdivide the Oligocene succession in the studied wells into the following foraminiferal Zones:

**Fig. 2. Correlation chart of the Oligocene rock-units between the studied wells in North Western Desert, Egypt.**

4. *Miogypsinoides complanatus/Lepidocyclus spp.* = of  
Chattian  
Age
- Nummulites bouillei Zone
3. *Globorotalia opima opima* Zone
2. *Globigerina ampliapertura* Zone
1. *Cassigerinella chipolensis* Zone of  
Rupelian  
Age

Table no. 2 shows the distribution of these biozones in the studied wells:

\* Figure in parenthesis represents the thickness of each biozone

### A. Foraminiferal Biozones

#### 4. *Miogypsinoides complanatus/Lepidocyclina spp.* Zone = *Nummulites* aff. *bouillei* Zone.

This Zone is characterised by the presence of *Miogypsinoides complanatus* SCHLUMBERGER, *Lepidocyclina (Nephrolepidina) parva* OPPENOORTH, *Lepidocyclina (Nephrolepidina) sumatraensis* BRADY, *Heterostegina costata* D'ORBIGNY, *Operculina* sp., *operculina venosa* FICHTEL & MOLL and *Miogypsin tani* DROOGER.

This zone is the reefal equivalent of the planktonic foraminiferal zone: *Globigerina ciperoensis ciperoensis* of Chattian Age.

The *Miogypsinoides complanatus/Lepidocyclina* sp. Zone is tentatively equivalent to the *Nummulites* aff./*bouillei* Zone.

The *Nummulites* aff. *bouillei* Zone is characterized by the presence of the following foraminiferal species: *Operculina* sp. *Miogypsin tani* DROOGER, *Heterostegina costata* D'ORBIGNY together with the following planktonic foraminifers: *Globigerina ampliapertura* BOLLI, *Globigerina praebulloides praebulloides* BLOW, *Globorotalia increbescens* BANDY, and *Globigerinita unicava primitiva* BANNER & BLOW, *Globigerina ouachitaensis ciperoensis* BOLLI, *Globigerina angulisuturalis* BOLLI, *Globigerina officinalis* SUBBOTINA, *Globigerina senilis* BANDY, *Globigerina venezuelana*, *Globigerina praebulloides leroyi* BANNER & BLOW.

BIOSTRATIGRAPHY OF THE SUBSURFACE  
OLIGOCENE SEDIMENTS

3. *Globorotalia opima opima* Zone:

This zone is characterized by the occurrence of the following planktonic foraminiferal species and subspecies: *Globorotalia increbescens* BANDY, *Globigerinata unicava primitiva* BANNER & BLOW, *Catapsydrax dissimilis* CUSHMAN & BERMUDEZ, *Globigerina praebulloides* BLOW, *Globigerina praebulloides praebulloides* BLOW, *Globigerina ouachitaensis gnaucki* BANNER & BLOW, *Globigerina ouachitaensis ciperoensis* BOLLI *Globigerina senilia* BANDY and *Globigerina eocaena* GUMBEL.

2. *Globigerina ampliapertura* Zone:

This zone was firstly recorded by Bassiouni *et al.* 1978 in the biostratigraphic zonation of the Oligocene rock units in Dabaa Well No. 1, (North Western Desert, Egypt), to comprise the interval between the extinction of *Globigerina selli* to the extinction of *Globigerina ampliapertura*.

Once the *G. selli* Zone is missed, the lower boundary of *Globigerina ampliapertura* Zone has been taken at the disappearance of *Cassigerinella chipolensis* CUSHMAN & PONTON.

This zone is characterized by the following planktonic foraminiferal species and subspecies:

*Globigerinata unicava unicava* (BOLLI, LOEBLICH & TAPPAN), *Globigerinata martini* BANNER & BLOW, *Globigerinata unicava primitiva* (BANNER & BLOW). *Globorotalia opima nana* BOLLI, *Globigerina officinalis* SUBBOTINA, *Globigerina praebulloides oculosa* BANNER & BLOW, *Globigerina euapertura* JENKINS, *Globigerina ampliapertura* BOLLI, *Globigerina senilis* BANDY, *Globigerina eocaena* GUMBEL, *Globigerina angulisuturalis* BOLLI, *Catapsydrax stainforthi* (BOLLI, LOEBLICH and TAPPAN), *Catapsydrax dissimilis dissimilis* CUSHMAN & BERMUDEZ, *Globigerina praebulloides leroyi* BANNER & BLOW.

1. *Cassigerinella chipolensis* Zone:

It has been noticed that this zone is very rich with the following planktonic foraminiferal association:

*Cassigerinella chipolensis* CUSHMAN & PONTON, *Globigerina eocaena* GUMBEL, *G. yeguensis pseudovenezuelana* BANNER & BLOW, *Globorotalia (Turborotalia) postcretacea* (MYSTRLUCK), *Globigerinata unicava primitiva* (BOLLI, LOEBLICH & TAPPAN), *Globigerina gortanii* BORSETTI, *Catapsydrax dissimilis dissimilis* CUSHMAN & BERMUDEZ, *Globigerinata pera* TOOD, *Globigerina foliata* BOLLI.

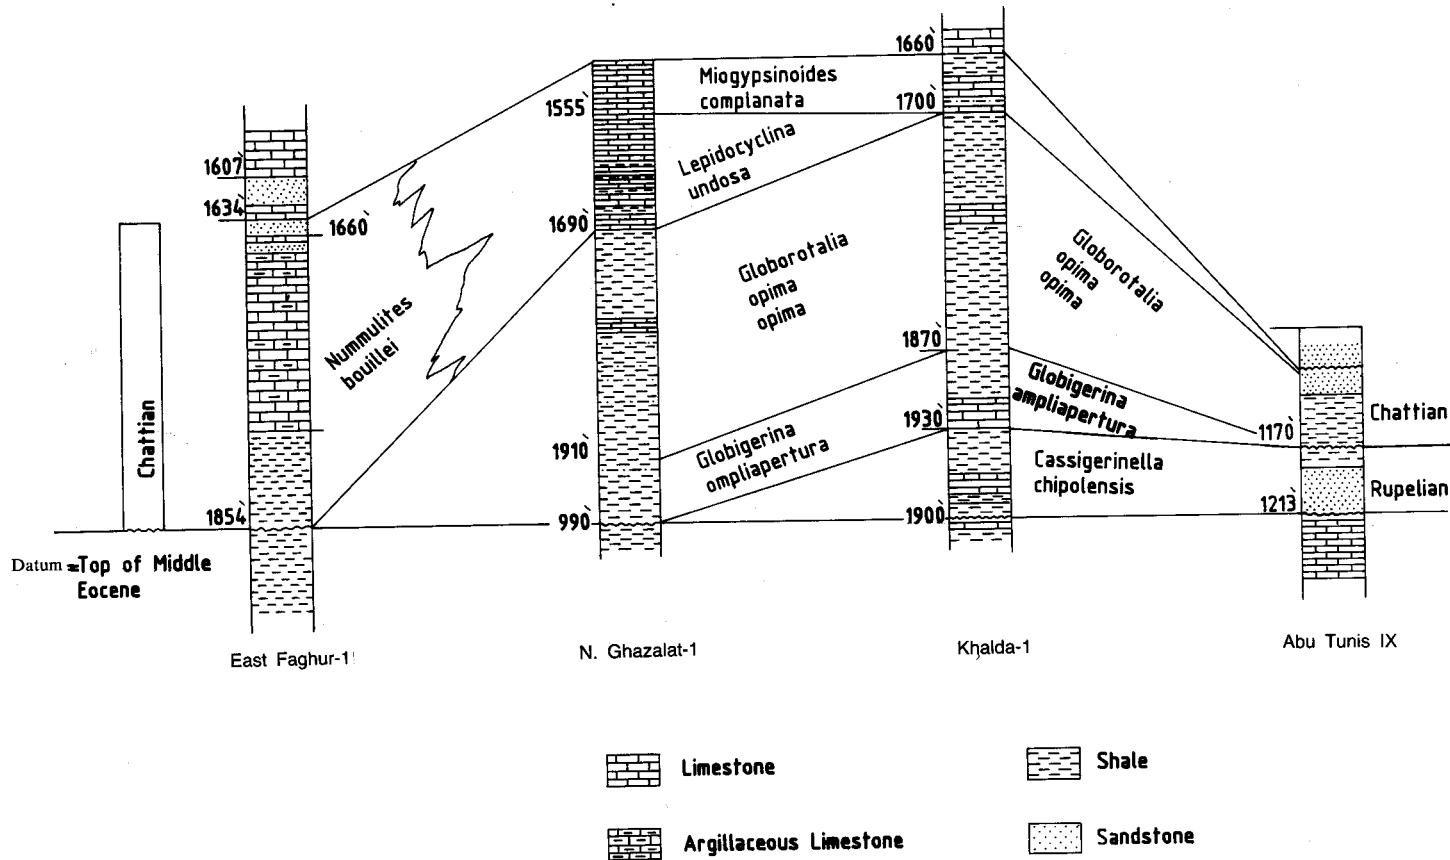

Figure (3) is a correlation chart of the Oligocene rocks between the studied wells in the North Western Desert, Egypt.

Two Ostracod assemblage zones are distinguished, they are, from top to base, as follows:

2. *Neocyprideis* spp. Zone.
  1. *Trachylebesis nodosus* Zone.
2. *Neocyprideis* sp. Zone:

This zone is recorded in three wells, they are, East Faghur Well no. 1, North Ghazalat Well no. 1 and Khalda Well no. 1.

In East Faghur Well no. 1, this zone consists mainly of 217 feet of limestone and is encountered

**Fig. 3: Correlation chart of the Oligocene rocks between the studied wells**

*BIOSTRATIGRAPHY OF THE SUBSURFACE  
OLIGOCENE SEDIMENTS*

between 1634 ft and 1851 ft and contains the following association: *Cytherella compressa* VON MUNSTER, *Ruggeria* sp<sub>1</sub>, *Ruggeria* sp<sub>2</sub>, *Loxoconcha* sp<sub>1</sub>, *Neocyprideis* n.sp<sub>2</sub> SALAHI, *Costa* sp<sub>1</sub>, *Costa* sp<sub>2</sub> and *Paracypris* sp<sub>1</sub>.

This zone is poor with the Ostracoda if compared with the underlying zone.

In North Ghazalat Well no. 1 this zone contains about 220 feet calcareous shale encountered between the interval from 1690' - 1910'. It coincides with the planktonic zone *Globorotalia opima opima*.

The following assemblage is recorded from this zone: *Bairdia gliberti* KEIJ, *Paracypris* sp<sub>1</sub>, *Loxoconcha* sp, *Costa* sp<sub>1</sub>, *Costa* sp<sub>2</sub>, *Ruggeria* n.sp<sub>2</sub> SALAHI, *Ruggeria* sp<sub>2</sub>, *Cytherelloidea* sp SONMEZ & GOKCEN and *Neocyprideis* n.sp<sub>2</sub> SALAHI. This assemblage is indication of open marine environment.

In Khalda Well no. 1 this zone is consisting mainly of 170 ft. thick of calcareous shale intercalated with few streaks of limestone.

This zone is characterised by the following species: *Bairdia gliberti* KEIJ, *Neocyprideis* n.sp<sub>2</sub> SALAHI, *Cytherelloides* sp. SONMEZ & GOKCEN, *Cytherella compressa* VON MUNSTER, *Ruggeria* sp<sub>1</sub>, *Ruggeria* sp<sub>2</sub>, *Ruggeria* n.sp<sub>2</sub> SALAHI, *Costa* sp<sub>1</sub>, *Costa* sp<sub>2</sub>, *Loxoconcha* sp<sub>1</sub>, and *Paracypris* sp<sub>1</sub>.

#### 1. *Trachylebesis nodosus* Zone:

The zone is only recorded from East Faghur Well no. 1. It belongs to the Middle Eocene (see Bassiouni *et al.* 1984).

This Eocene ostracod zone is characterized by the following association:

*Krithe bartonesis* JONES, *Paracypris contracta* JONES, *Loxoconcha matiensis* KHALIFA & CRONIN, *Trachylebris nodosus nodosus* BASSIOUNI, *Novocypris eocenanus* DUCASSE, *Bradleya oertlii* DUCASSE.

This zone is coincided with the Middle Eocene *Nummulites beamounti* Zone in East Faghur Well no. 1. As a result of the above mentioned zone we concluded that there is unconformity between the Middle Eocene and the Middle Oligocene; as both Upper Eocene and a great part of the Lower Oligocene sections have been missed in the area.

These ostracoda and larger foraminiferal assemblage are reflecting shallow marine condition during that time.

### III. Conclusion

The Eocene-Oligocene boundary is traced at the disappearance of *Globigerina pseudoampliapertura*, *Hantkenina* spp and *Bulimina jacksonensis* which are characteristic of the Late Eocene, and the first appearance of *Cassigerella chipolensis*. So, the *Cassigerella chipolensis* Zone is related to the Middle Oligocene (Rupelian stage). The *Globorotalia opima opima* Zone and *Globigerina ampliapertura* Zone were considered by Banner & Blow (1962) to be of Aquitanian age. In the present study the *Globorotalia opima opima* Zone is overlain conformably by *Miogypsinoides complanatus* Zone which is of Chattian Age.

PLATE 8

## بيوستراتجرافية رسوبيات الأوليوجوسين تحت السطحية ، شمال الصحراء الغربية

محمد يوسف حسن ، محمد البخاري ، جمال سلوم ، حسن الشيخ

يشتمل هذا البحث على دراسة للفورامينفرا المائمة والفورامينفرا الكبيرة ،  
والاوستراكودا المفصولة من رسوبيات عصر الأوليوجوسين من أربعة آبارهم :  
أبوتونس رقم ٩ ، شرق فاغور رقم ١ ، خالده رقم ١ وشمالا غزلات رقم ١  
وكلها تقع في شمال الصحراء الغربية . وقد أمكن تمييز عدة نطق حيوية فورامينفريه  
هم على التوالي ، من أعلى إلى أسفل :  
٤ - نطق ميوجيسينوبيدس كومبلناتس / ليديوسيكلينا والذي يكافئ نطاق  
النيموليتيس بوليلي .  
٣ - نطاق جلوبيرو تاليا أوبيما أوبيما .  
٢ - نطاق امبلي أبرتيورا .  
١ - نطاق كاسيجيرينيلا شبوليسيس .  
والنطاقان ١ ، ٢ يتبعان العمر الروبيلي ، والنطاقان ٣ ، ٤ يتبعان العمر  
الكافي . وقد تمت مضاهاته النطاق رقم ٤ بمثيله في تونس ( انظر بحث بيلي ، كولر  
. ) ١٩٧٦ .
